**Annual Plant Reviews, Cell Cycle Control and Plant Development** Jul 19 2021 The cell cycle in plants consists of an ordered set of events, including DNA replication and mitosis, that culminates in cell division. As cell division is a fundamental part of a plant's existence and the basis for tissue repair, development and growth, a full understanding of all aspects of this process is of pivotal importance. Cell Cycle Control and Plant Development commences with an introductory chapter and is broadly divided into two parts. Part 1 details the basic cell machinery, with chapters covering cyclin-dependent kinases (CDKs), cyclins, CDK inhibitors, proteolysis, CDK phosphorylation, and E2F/DP transcription factors. Part 2, which describes the cell cycle and plant development, covers cell cycle activation, cell cycle control during leaf development, endoreduplication, the cell cycle and trichome, fruit and endosperm development, the hormonal control of cell division and environmental stress, and cell cycle exit. The editor of this important book, Professor Dirk Inzé, well known and respected internationally, has brought together an impressive team of contributing authors, providing an excellent new volume in Blackwell Publishing's Annual Plant Reviews Series. The book is an essential purchase for research teams working in the areas of plant sciences and molecular, cell and developmental biology. All libraries in universities and research establishments where biological sciences are studied and taught should have copies of this essential and timely volume.

*Microcirculation in Cancer Metastasis* Feb 11 2021 Although mechanisms involved in the spread of cancer have been the subject of a major research endeavor over the past decade, metastatic tumors still account for significant clinical morbidity and the failure of cancer treatment. Not only are the vascular pathways the most common route for the dissemination of cancer cells, but interactions between the cells and the circulation act as important rate-regulators for the metastatic process. This authoritative, multi-authored volume addresses the importance of microcirculation in cancer metastasis. The book begins with up-to-date reviews on the biology of endothelial cells and the structure and physiology of the normal and tumor microcirculations, and then emphasizes interactions between components of the microcirculation and cancer cells. Metastasis is discussed through chapters exploring the entry of cancer cells into the circulation, the biophysics and morphology of cancer cell traffic and arrest, interactions with host cells and the basement membranes, and angiogenesis. This fascinating book will interest oncologists, pathologists, and students of metastasis or the microcirculation.

**Ultrafast Physical Processes in Semiconductors** Aug 27 2019 Since its inception in 1966, the series of numbered volumes known as Semiconductors and Semimetals has distinguished itself through the careful selection of well-known authors, editors, and contributors. The Willardson and Beer series, as it is widely known, has succeeded in producing numerous landmark volumes and chapters. Not only did many of these volumes make an impact at the time of their publication, but they continue to be well-cited years after their original release. Recently, Professor Eicke R. Weber of the University of California at Berkeley joined as a co-editor of the series.
